

Case Study: Automating Advanced Therapy Eligibility Review for Medical Facilities

Overview

A healthcare organization relied on a highly manual process to review patient medical charts, determine eligibility for advanced therapy, and notify care facilities for approval. This workflow was time-consuming and difficult to scale as patient volume increased. Silicon Tundra designed and implemented an end-to-end automation using **Power Automate** that streamlined chart review, patient classification, and facility notification—while ensuring ongoing re-evaluation of patients over time.

The Challenge

The existing process required staff to manually review uploaded medical charts, extract relevant clinical information, compare it against eligibility criteria, and communicate results to care facilities. This resulted in:

- Significant administrative overhead
- Delays in identifying patients eligible for advanced therapy
- Inconsistent follow-up for patients who did not initially qualify

The organization needed a reliable, repeatable system that could handle chart intake, eligibility determination, notifications, and periodic rechecks—without increasing staffing needs.

The Solution

Silicon Tundra built an automated workflow in **Power Automate** that replaced the manual review process with a structured, auditable, and scalable system.

Key automation steps included:

- Patient medical charts in a pdf format were uploaded into a designated **SharePoint** folder.
 - Using **Power Automate's** AI capabilities, multiple models were trained to analyze patient charts and extract relevant clinical data.
 - Extracted data was normalized and stored in structured tables for downstream processing.
 - Patient data was automatically compared against predefined risk diagnoses and medication criteria.
 - Patients were classified as either qualifying or not qualifying for advanced therapy.
 - Personalized PDF letters were generated for each care facility summarizing patient eligibility.
 - Letters were emailed directly to the facilities to review and formally sign off on treatment.
 - Patients who did not initially qualify were automatically re-evaluated every **90 days** to determine if eligibility status had changed.
-

Results & Impact

- **Eliminated manual chart review**, saving significant staff time
- **Accelerated identification** of patients eligible for advanced therapy
- **Improved consistency and accuracy** in eligibility determinations
- **Closed the loop with care facilities** through automated documentation and notifications
- **Ensured no patient was overlooked** by implementing automated 90-day rechecks

The solution transformed a fragmented, manual process into a fully automated workflow that improved operational efficiency, reduced delays in care decisions, and supported better patient outcomes.

Technologies Used

- Power Automate
- SharePoint
- Automated PDF generation and email delivery
